

MR Nandrolone 300

DECA 300 is one of the most popular anabolic steroids intended for building serious muscle mass. In the case of sufficient supply of the protein, it has an exceptional ability to increase muscle and strength gains. It represents the ideal combination to gain massive muscle mass. NANDROLONE DECANOATE 300 suppresses pain in the joints and helps regenerate them for its ability to increase collagen synthesis. NANDROLONE DECANOATE 300 does not act hepatotoxic and it is also very interesting for users who already have liver problems or want to avoid substances toxic to the liver.

CHARACTERISTICS

Nandrolone was first described in 1960 and for its unique features has become one of the most popular anabolics in the world. Structurally very similar to testosterone, but lacks carbon 19 (i.e. CH₃ methyl group on carbon 10). It is therefore referred to as "19-nortestosterone." Its popularity stems from the fact that it has significant anabolic effects accompanied by only a minimal androgenic effect. In terms of the ratio of anabolic effects and side effects, it is therefore sometimes considered to be the best ever steroid. It binds well to androgen receptors.

Nandrolone can be effectively used in both volume and definition cycles. It has anti-inflammatory abilities and improves collagen synthesis, making it renowned for its ability to treat injuries of joints and tendons. Athletes report that this preparation helps treat pain in shoulders, knees and elbows. It also dramatically improves nitrogen retention and regeneration. Currently, nandrolone, due to its positive characteristics, is used in medicine, for example in patients suffering from AIDS. It has been shown that they not only increase the weight, it helps to boost the immune system as well.

SIDE EFFECTS

Nandrolone is considered a very safe steroid. In fact, in the tissue through the action of 5-alpha reductase inhibitors it does not transform to dihydrotestosterone (DHT), but nordihydrotestosterone (Nordh), which has less androgen effect than dihydrotestosterone (DHT). Nandrolone is therefore the perfect choice for those who do not want the use of steroids cause

them to lose hair or suffer from prostate problems. While taking finasteride (Propecia) to prevent hair loss, unpleasant paradox can occur. Finasteride prevents the conversion of nandrolone to norDHT and Deca hits the hair roots with full force. This chemical process unfortunately does not work only on paper and is reaffirmed by dozens of unpleasantly surprised exercisers.

During normal dose (250-500 mg) nandrolone aromatizes only in small amounts. Nandrolone acts more like progestin. Progestogen side effects are almost identical to estrogenic side effects, which include: severe suppression of endogenous production of testosterone, gynecomastia and excessive water retention. It was found that the activity of progestogens is closely related to the activity of estrogen in the body. There are some other side effects associated with progestins, which cannot be found in any other anabolic steroids

DOSAGE

The dosage is generally between 250-500 mg per week. For beginners, sufficient amount is often only 250 mg per week. Doses above 500 mg per week are meaningless because they do not provide adequate contrast effect and increase the risk of side effects. Nandrolone decanoate has a half-life of about 15 days, and therefore it should be used twice a week, in regular intervals, to ensure a stable level of preparation in blood. When using nandrolone decanoate, first results may appear after 1 month of use. To achieve a sufficient effect at least two months cycles needed, but preferably 3-4 month cycle. It is recommended that for each nandrolone cure testosterone is used for the maintenance of normal physiological functions of testosterone. The substance stays in the body for 18 months.

DECA 300 EFFECTS :

-HEAVY MASS GAINS

-PUMPS

-STRENGTH

-REGENERATION OF MUSCLE FIBERS , BONES , JOINTS .
